This Program Overview is brought to you for free and open access by the NSU Course Catalogs and Course Descriptions at NSUWorks. It has been accepted for inclusion in College of Engineering and Computing Course Catalogs by an authorized administrator of NSUWorks. For more information, please contact nsuworks@nova.edu.
Doctor of Arts in
INFORMATION SCIENCE
A FIELD-BASED PROGRAM FOR LIBRARIANS AND INFORMATION MANAGERS

The Program—"Study while you work"
Nova University now makes it possible for you to earn a doctoral degree while you continue to work. The field-based Doctor of Arts in Information Science (D.A.I.S.) program brings Nova University to you. Most of the D.A.I.S. program can be completed at your place of employment or in your home in as little as three years.

Courses—"Computer instruction"
The D.A.I.S. curriculum consists of five "core courses" completed through a computer-based learning system. Once you are provided with a computer terminal, you will begin a unique "on-line" study experience. You will use the computer to study in such areas as computer science, systems analysis and design, networking, telecommunications, and strategic management techniques for libraries and information centers.

Practicums—"Research that counts"
Practicums are applied research projects related to the core courses undertaken to address significant problems in institutions and organizations. At any time during the program you encounter problems or have questions that need immediate attention, Nova "on-campus" faculty are available through electronic mail or telephone for guidance and answers.

Regional Seminars—"Bringing it all together"
Each year, you will attend four weekend seminars. These meetings give you the opportunity to share your progress and experiences with other D.A.I.S. students. Recognized authorities in information science conduct the sessions. These experts share the latest developments in digital computers, telecommunications, and information science. Seminars help integrate what you have learned in the core courses, practicums and in the field project.

Tuition—"No hidden expenses"
Aside from textbooks and seminar travel expenses, all courseware and communications equipment are included in the $3,500 per year tuition. A partial payment plan of $875.00 per quarter is available to help make tuition manageable. A tuition reduction will be made if you have a computer terminal available.

Enrollment—"Targeted admission"
An important condition for entering the program and earning a degree is that you be currently employed in a library or information center. A master's degree in library or information science is also required.
Applications are now being accepted for the D.A.I.S. program that begins in October, 1983.

Information—"Immediate answers"
Call us today at (305) 475-7300 or in Florida call toll free 1-800-432-5021 or for a brochure and application materials write to:
Nova University
Information Sciences
3301 College Avenue
Fort Lauderdale, Florida 33314

Nova University
Nova University is accredited by the Southern Association of Colleges and Schools and admits students of any race, color, and national or ethnic origin.
The major purpose of the Nova Doctor of Arts in Information Science program is to provide a rich learning environment for librarians and information managers. The program facilitates the design and application of information systems based on the emerging technologies in computers and telecommunications. The program enables students to develop automated processes and systems in their work environments that take full advantage of the latest in software tools and hardware designs. For this reason the program has been designed to operate in a Unix operating system environment. The Unix operating system is rapidly expanding into almost all fields of computer usage from mainframe environments to office computers to personal micros. Unix was developed at Bell Laboratories to foster a cooperative atmosphere among scientists and engineers. The system is used in this program, not only for its extensive set of tools for automation, but also to facilitate idea sharing and joint projects among the practitioners enrolled. Unix operates at Nova University on two Digital Equipment Corporation mainframe computers: a VAX 11/780 and a DEC-20. Selection of either system is made through a port selector. Students make the telephone connection to Nova's computers by dialing phone numbers in their local area (package switching makes this facility possible at no additional cost to the student for phone calls). Up to 32 hours of connect time on Nova's computers are provided to students in each course as a part of tuition. Additional time is paid for by the student. These overtime charges are by computer connect hour and also a charge for the telephone time -- telephone charges vary with location of the student.

The Student's Terminal Interface

Each student receives a computer terminal and modem to pursue the program. The cost for this equipment is included in tuition. The terminal has an 80 column screen and full ASCII keyboard. The modem operates at either 300 baud or 1200 baud. Students receive the use of the terminal and modem for the three years. For a small fee at the end of the program students may elect to keep the terminal and modem for their own use.

Computer-assisted Instruction

The Unix system includes numerous software tools in a command interpreter called the Shell. The Shell enables students to communicate "on line" with professors and also provides a vehicle for student-to-student dialog about projects and problems. This is accomplished through programs in the Shell called "mail" and "write." These utilities enable students and professors to mail documents, ask questions of professors or certain
CORE COURSES

Students must complete six core courses. Each course is scheduled for six months. The semester and contact hours for each course are explained below. The course descriptions follow.

Course Credit -- Five (5) Semester Hours
Time Span -- Six Months
Total Contact Hours = 75
Teleconferences:
  Audio (Telephone) -- Two required at 2 hours each
  Computer Conference on DAISNET -- One required at 3 hours
Regional Seminars -- Two (2) of 18 contact hours each = 36 hours
Interactive Computer Time -- Thirty-two (32) hours
Preparation and Reading -- Fifty (50) hours

DIGITAL COMPUTERS FOR INFORMATION MANAGEMENT

This course is a prerequisite to all others. The student will be required to demonstrate mastery of key concepts and rules pertaining to the use of digital computers. Topics include: computer operating systems (VMS, UNIX, CP/M, etc.), data structures, text editors (ed and vi), data base management systems (ingres and datatrieve), word processing (nroff, Wordstar, etc.), microcomputer hardware (microprocessors, disk drives, printers, and displays) and software (The Bridge emulator), applications packages (VisiCalc, VisiTrend, VisiPlot and their clones), computer graphics, and data communications. Much of the student's work in this course will be facilitated through LEARN CAI software on the DEC-VAX-11/780 (Introduction to the C programming language, files, macros, editors, etc.).

Courseware materials include student guides, guided design protocols, case analysis documents, overlays, audio tapes, and schedules. All courseware is integrated with VAX structures.

COMPUTER-BASED RESEARCH AND STATISTICS FOR INFORMATION SCIENCE

Course content includes: research methodologies from various disciplines (experimental and quasi-experimental, historical, case study, etc.); sampling techniques; continuation of structured programming ("c", PASCAL, and ADA); data base management systems in research designs: QUEL and EQUEL for Ingres; descriptive statistics, non-parametric statistical tests; linear statistical models: linear regression, multiple regression, ANOVA, canonical analysis, discriminant function analysis, path analysis, dynamic correlations, and factor analysis; survey construction and attitude measurement; item analysis; quality control analysis, evaluation methodologies; computational linguistics using digital computers: concordances, word frequency, readability computations, automatic
artificial intelligence; CAI systems for learning on-line searching;
library automation: cataloging, circulation, acquisitions, and serials;
criteria for the selection of systems and financial considerations in
automation: pricing, budgeting, appropriations, and RFP development;
on-line graphics; microcomputer systems for information searching and
storing: ERIC, etc.; text and word processing: mainframe and micro-
computer; human factors considerations in computer systems; and case study
exercises. Feasibility studies, systems documentation, and evaluation
reports from actual libraries and information centers are used throughout
this course where students are required to read, question, analyze, and
synthesize the information and to review alternative solutions to problems.
The work of students in this area will be facilitated with on-line "guided
design" courseware similar to the manual version created by Charles Wales
at West Virginia University.

SYSTEMS ANALYSIS, SYSTEMS DESIGN, OPERATIONS RESEARCH, AND COMPUTER
SIMULATION IN INFORMATION SCIENCE

The goal of this course is to prepare information professionals to conduct
studies of the factors in their organizations that contribute to effective
operations, to examine alternative ways of doing things, to assist in the
design of information systems within their organizations, and to make
strategic decisions that strengthen their enterprises. Systems analysis/
design and operations research are paradigms that can help information
workers facilitate this end. Topics include: stochastic and monte carlo
techniques; computer simulation modeling and validation (DYNAMO--System
Dynamics and Urban Dynamics, GPSS, SIMSCRIPT, and GASP); Markov chains;
probabilistic inventory models; optimization of networks; waiting line
decision theory; graph theory, circulation models, information retrieval
search modeling; design of a data base; administration of a data base;
data coding and validation, design of an information system, feasibility
studies; implementation and testing; human aspects of information systems;
optimal storage of materials; models for journal selection; literature
growth, obsolescence, and scattering models; usage patterns, optimal staff
size; effects of shifting costs to users; measuring effectiveness and
efficiency; acquisition models; human factors in library environments;
accountability; reference service models; and space utilization strategies.

DATABASE MANAGEMENT SYSTEMS, TEXT PROCESSING,
AND INFORMATION RETRIEVAL

Database management systems, hierarchical and relational models, design
philosophies, data dictionaries and data directories, query languages:
ingres, dBASE-II, condor, and datatrieve, database administration,
management of data, menu design, database planning, virtual memory, trade-
offs in dbms design, distributed databases, reports preparation from a dbms,
creating, modifying, and maintaining a database under ingres, addressing
ingres from Unix, quel and equel in ingres, security, and dbms evaluation,
auto text processing systems (nroff, wordstar and pr) and applications to
libraries and information centers.
REGIONAL SEMINARS

Students are required to attend four regional seminars each year of the three year program. Seminars begin Friday evening and adjourn on Sunday afternoon. Pre-seminar assignments are given to each student. These seminars will be held in various geographical locations. Opportunities are provided for in-depth discussion, lectures, video presentations, examinations, and idea sharing among conferees. In addition, demonstrations of the latest developments in digital computers, telecommunications, and information science will be provided. Professionals from universities, government agencies, and industry will serve as presenters. Students are required to provide their own lodging and travel expenses at these seminars.

1. Operating Systems: The UNIX Environment for Information Management

Unix history and system evolution, programming the Unix Shell, files and directories, programming with Unix tools, filters, pipes, computer aids for writers (style, spell, diction), modern programming methodologies, development projects, formatting documents, editors (ed, sed, ex and vi), user to user communication (mail and write), the literature on Unix, and the Berkeley Unix System.

2. The Role of the Microcomputer in the Library and Information Center

Continuation of operating systems including advanced Unix programming environments. CP/M, Unica, and Xenix are reviewed. Students participate in demonstrations of popular microcomputers to develop skills in selection and application of personal computers. Implications for the changing nature of learning and information use are discussed. Detailed presentations are given concerning the hardware capabilities of machines using the following microprocessors (Z-80, 8080, 8085, 8088, 6502, 6800, 6809, 8001 and 68000). Machine language programs are reviewed.

3. Technical Services

The focus of this seminar is on the improvement of technical services in libraries and information facilities. Methods of acquiring and processing various kinds of collections and holdings are covered. Other topics include: utilization of commercial vendors and consultants; co-ordination of public service and technical services; and utilization of networks for the benefit of users.

4. On-Line Catalogs and Information Systems

In this seminar students are given opportunities to examine compatible and incompatible systems. The organization and function of various systems are compared using techniques in management, evaluation, and statistical measurement. Primary focus is on improving technical services.
10. **Courseware Development, Learning Theory, Media, and Individualized Instruction in the Library**

   The role of libraries in adult education is increasing. This seminar provides an update on the latest developments for designing instructional systems for adult education and users of information services. Topics include: Computer-aided instruction; computer managed instruction; AICAI; learning theories; design of courseware for sale to users; developments in media research and applications.

11. **Automated Systems for Bibliographical Organization and Control**

   Deals with descriptive cataloging theory, access to subject information, classification systems, and use of robotics in the library. The most recent developments and applications of automation are discussed (acquisitions, serials control, accounting, cataloging, and circulation).

12. **Public Services**

   Subject areas in this seminar include the following: outreach programs, reference services, data-base searching, circulation, and techniques for providing instruction to users. Human factors aspects of the user/personnel interface are considered, and examples of successful operations are demonstrated. Software selection for education and training programs is covered.
